Final Implantation

Preoperative Planning

The anatomic landmarks in the knee joint are defined preoperatively by imaging the whole leg on the healthy side and the affected side in the standing position. The angle between the anatomic axis (center of knee joint – intramedullary canal) and the mechanical axis (center of femoral head – center of knee joint – center of ankle to the second toe) determines the valgus angle (01).

These angles should be determined for both knees. The valgus angle of a healthy knee joint is approximately 5°-7°. In comparison with the healthy side, and for the purpose of reconstructing the corresponding valgus angle in the affected knee joint, this angle must be determined before carrying out the distal femoral resection. The appropriate implant size can be estimated preoperatively with X-ray Templates. The necessary resections are determined by the size of the implant and the deformity corrections required.

Approaches

With the knee in slight flexion, a straight incision is made over the patella, as far as the tibial tuberosity (02).

A medial parapatellar incision is made through the patellar retinaculum, capsule and synovial membrane (03).

When making the parapatellar incision, the patella is pushed to one side to visualize the patellofemoral joint. Removal of the hypertrophic synovial membrane and parts of the fat pad allows access to the medial, lateral and intracondylar parts of the joint. Excess synovium should be removed in order to avoid postoperative impingement and adhesions. Some surgeons prefer total synovectomy.

02

03

Alternative Approaches:

Midvastus

04

Subvastus

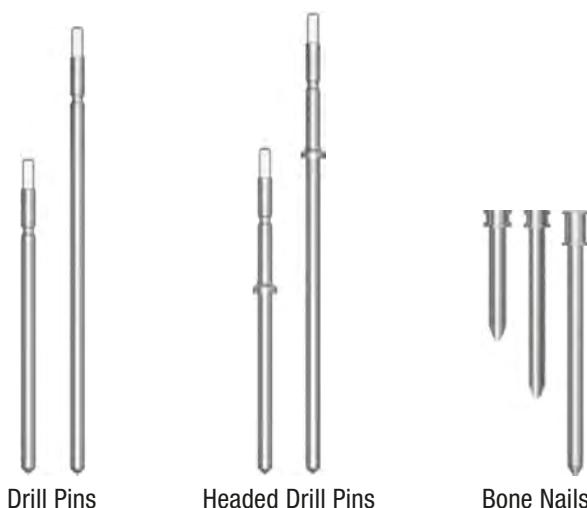

05

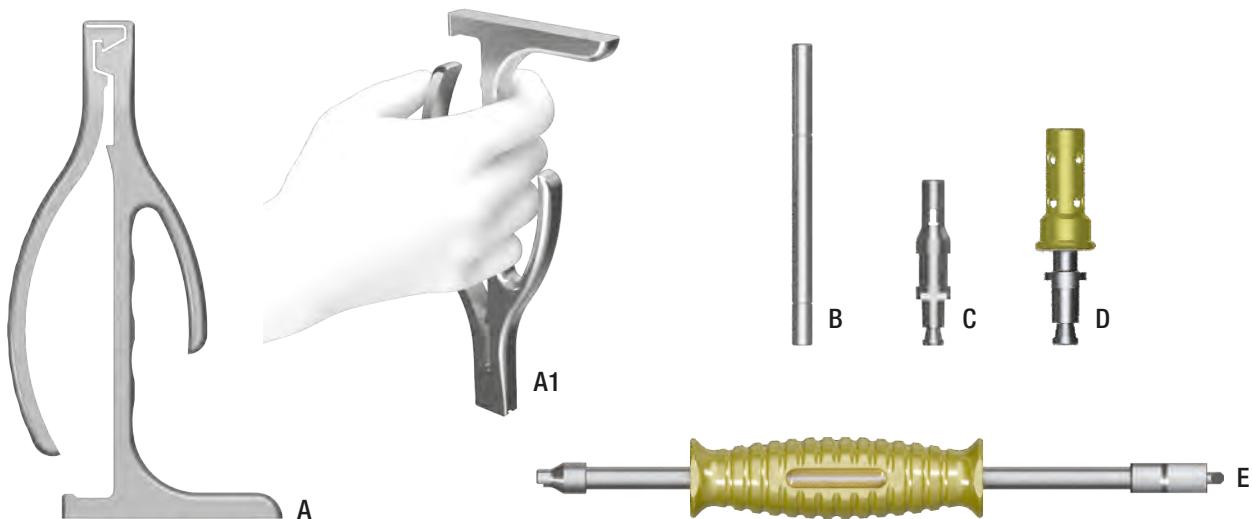

All previously mentioned approaches can be also performed as minimally invasive approaches with small incisions.

Pins, Pin Instruments and Sawblades

The *LinkSyphoKnee* Instruments are designed to be used with:

The Drill Pins, Headed Drill Pins and Bone Nails may be hammered in using the Universal Pin Inserter/Extractor (**A**) or the Universal Pin Inserter (**B**). The Drill Pins, Headed Drill Pins and Bone Nails may be pulled out using the Universal Pin Inserter/Extractor (**A**), the Drill Pins and Headed Drill Pins are also designed to be drilled in and removed using the Power Driver (**C**) or the Power Driver with Snap Lock (**D**). The Bone Nail may be pulled out using the Universal Pin Inserter/Extractor (**A**) or the Slaphammer (**E**).

Use the Universal Pin Inserter/Extractor (**A**) as shown in the picture (**A1**).

OPTIONAL:

The *LinkSyphoKnee* Instruments are designed to be used also with Thread Pins*, headed or not headed.

ATTENTION: The Thread Pins* are designed to be drilled in and removed using the Power Driver (**C**) or the Power Driver with Snap Lock (**D**) only.

* only upon request

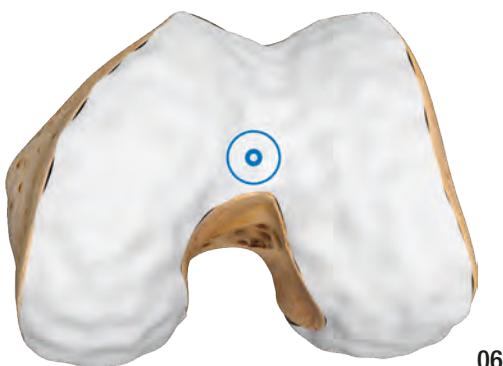

The *LinkSyphoKnee* Instruments are designed for use with Sawblades up to a max. thickness of 1.27 mm (page 107).

Determination of the Femoral Resection Level

For femoral preparation, the knee is flexed to 90°. The entry point for opening the femur can be marked with an electrocautery, as in illustration (06). It is usually located approx. 3-5 mm medially above the intercondylar fossa. The medullary canal is opened with the Step Drill (07).

06

07

Instruments

319-505/00B
Step Drill

Femoral Alignment Guide Assembly

In order to lock the Femoral Cutting Block, Distal Cut with the Femoral Alignment Guide, twist the knob of the Femoral Alignment Guide, varus/valgus adjustment, clockwise until it clicks in the "lock position" (08).

08

Slide the Femoral Alignment Guide onto the Intramedullary Rod (09).

09

varus/valgus adjustment

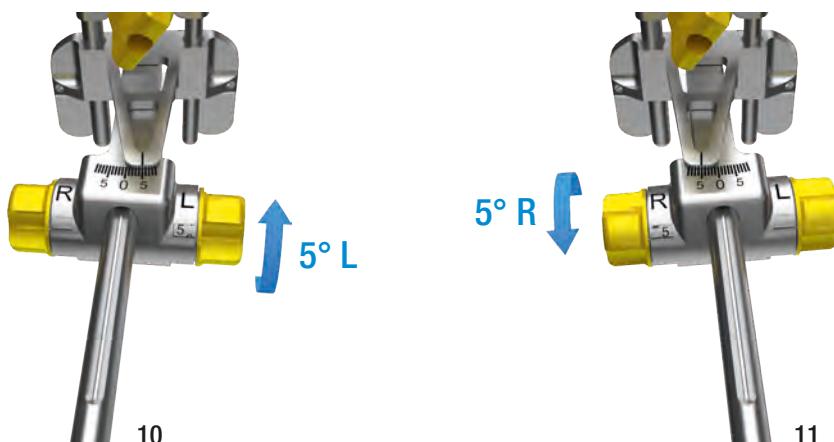

445-101/00
Intramedullary Rod

Femoral Intramedullary Alignment

Use preoperative X-rays to define the patient's appropriate mechanical axis. Set the valgus angle (left or right – 0° to 9°) on the Femoral Alignment Guide, varus/valgus adjustment, by rotating the appropriate knobs.

Rotate the knob marked with "L" for selecting the desired angle for a left knee (10).

Rotate the knob marked with "R" for selecting the desired angle for a right knee (11).

Slowly introduce the Intramedullary Rod with the Femoral Alignment Guide to prevent building up pressure in the canal. Insert it far enough to ensure the most accurate replication of the anatomic axis (12).

ATTENTION: Before fixing the Femoral Cutting Block with two pins, it must be ensured that at least one condyle is in contact with the alignment instrument, and that the valgus angle of the correct side has been set.

Instruments

445-104/00
Femoral Cutting Block,
distal cut

445-102/00
Femoral Alignment Guide,
varus/valgus adjustment

445-101/00
Intramedullary Rod

OPTIONAL: For additional fixation, impact a Bone Nail (13) on the medial or lateral side of the Femoral Alignment Guide until the head of the Bone Nail is flush with the plate.

OPTIONAL: To confirm the valgus angle, attach the Quick Connect Handle to the Femoral Cutting Block and then insert the Alignment Rod into the Quick Connect Handle. Extend the Alignment Rod assembly to the center of the femoral head (14).

Instruments

Alignment Rods:
445-113/10 short,

Handle, quick connect

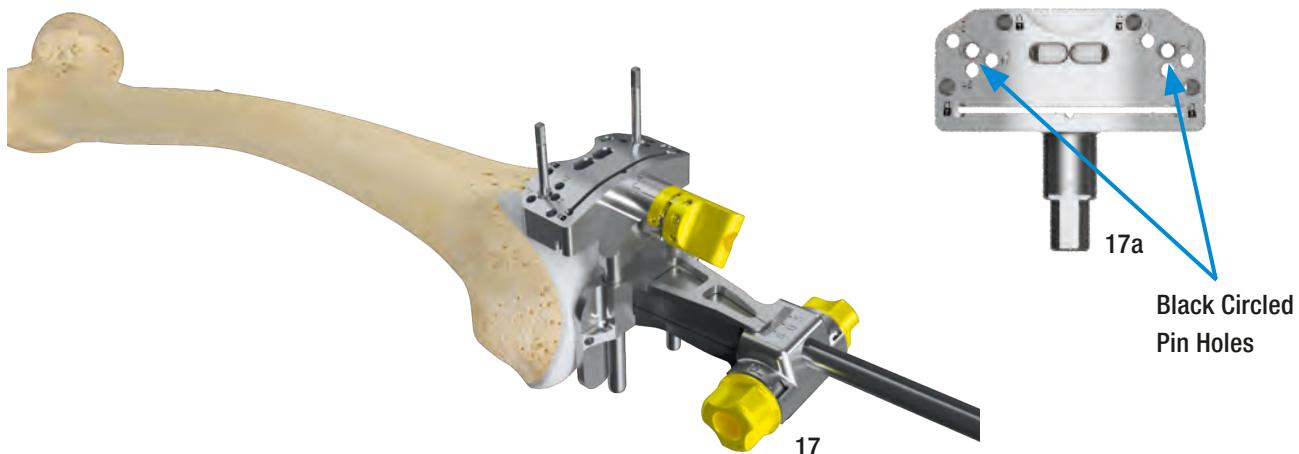

445-128/25
Bone Nail

The Alignment Rods are connected by inserting and twisting the pin of the long Alignment Rod into the slot of the short Alignment Rod (15+16).

Insert a Drill Pin through each of the black circled pin holes (17a) on the anterior surface of the Femoral Cutting Block (17).

Release the knob of the Femoral Alignment Guide by rotating it counterclockwise. Remove the Femoral Alignment Guide together with the Intramedullary Rod and leave the Femoral Cutting Block in situ (18).

Alignment Rods: 445-113/10 short, 445-113/20 long

Distal Femoral Resection

The Cutting Template can be used to check the level of the distal resection (19).

To fully secure the Femoral Cutting Block to the femur, two Headed Drill Pins are inserted into oblique holes (20).

Use an oscillating saw and a Sawblade (max. 1.27 mm thick) through the cut slot to resect the distal femur (21).

Remove the Cutting Block.

Extramedullary Tibial Guide

EM Tibial Guide final assembly (23).

Instruments

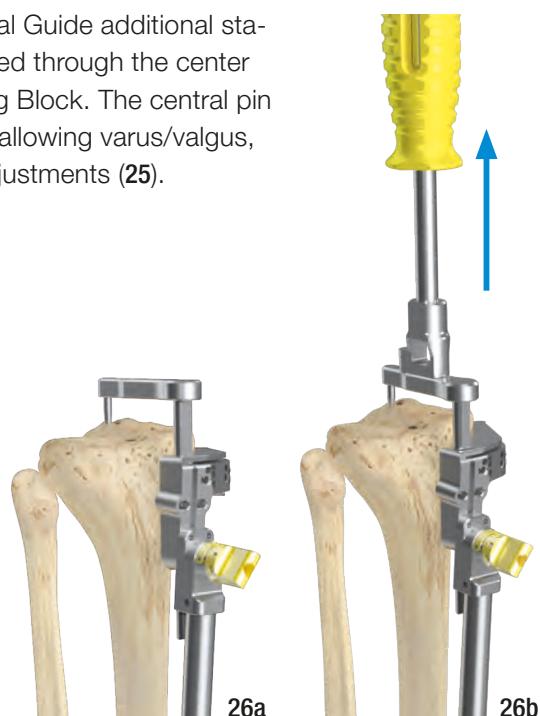

Extramedullary Tibial Guide Alignment

Position the knee at 90° of flexion with the tibia translated anteriorly and the whole leg held firmly in place on the surgical table. Place the Tibial Cutting Block against the proximal tibia. The Locking Cam on the Proximal Tube is used for macro-adjusting the height of the Tibial Cutting Block. Adjust the EM Tibial Guide to the approximate length of the tibia (24) by closing the Locking Cam.

Align the Proximal Tube with the medial aspect of the tibial tubercle to set the rotation.

OPTIONAL: In order give the EM Tibial Guide additional stability, a Headed Drill Pin can be inserted through the center of the vertical slot on the Tibial Cutting Block. The central pin stabilizes the Tibial Cutting Block still allowing varus/valgus, posterior slope and resection level adjustments (25).

OPTIONAL: As an alternative to a Headed Drill Pin, the Spike Rod can be used to give the EM Tibial Guide additional stability (26a). Use the Slaphammer to remove or reposition the Spike Rod, if necessary (26b).

Instruments

445-206/00
Slaphammer

Slope Adjustment

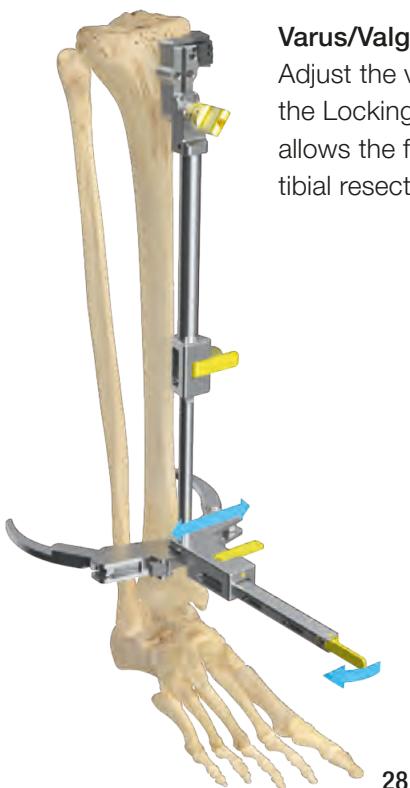

Adjust the slope of the EM Tibial Guide on the sagittal plane, releasing the Locking Cam on the Distal Rod (27). Insert the Cutting Template or a free blade into the slot of the Tibial Cutting Block to help assess the expected slope of the tibial resection.

ATTENTION: All *LinkSyphoKnee* Tibial Components feature a central stem tilted 3° posteriorly.

Varus/Valgus Adjustment

Adjust the varus/valgus alignment of the EM Tibial Guide by releasing the Locking Cam at the distal end of the Ankle Clamp (28). This adjustment allows the frontal alignment of the EM Tibial Guide, avoiding varus or valgus tibial resection.

881-210/03
Tibial Cutting Block, 3° right

Setting the Tibial Resection Level

Insert the foot of the Adjustable Stylus into the slot of the Tibial Cutting Block and adjust it to the appropriate level. Release the Locking Cam on the Proximal Tube to allow for micro-adjusting the height of the Tibial Cutting Block (29).

The scale on the body of the Adjustable Stylus indicates the amount of bone and residual cartilage to be resected (30).

ATTENTION:

Do not change the setting of the Adjustable Stylus while the instrument is in contact with the bone.

Push the entire construct upwards, until the Stylus is not in contact anymore, and only then change the setting.

ATTENTION:

LinkSyphoKnee Fixed Bearing CR (Cruciate Retaining), **Fixed Bearing PS** (Posterior Stabilized), **Fixed Bearing PS+** (Posterior Stabilized +) and **All-Poly PS Tibial Component** feature 10 mm of minimum tibial component thickness (tibial baseplate + PE articulating surface).

Set the Adjustable Stylus according to the patient's anatomic situation, to avoid excessive tibial resection.

Confirm tibial resection level using Cutting Template introduced as a free saw blade into the Cutting Block.

445-111/00
Adjustable Stylus

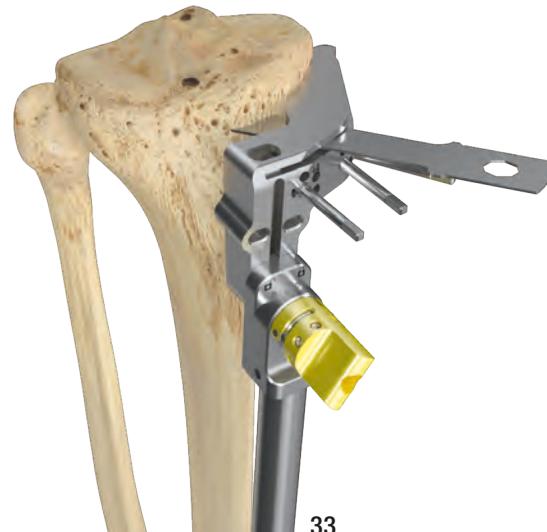

Tibial Resection

After the tibial resection level has been set, close the Locking Cam on the EM Tibial Proximal Tube and pin the Tibial Cutting Block through the anterior parallel "O" holes, using two Drill Pins (31).

The resection level can be adjusted by repositioning the Tibial Cutting Block (proximal 2 mm, distal 2 mm or 4 mm). If desired, the cutting block can be more securely fixed with an additional Headed Drill Pin placed through the distal angled hole.

OPTIONAL: To assess tibial alignment, attach the Quick Connect Handle to the Tibial Cutting Block, and insert the Alignment Rod. The alignment can be checked by ensuring that the Alignment Rod remains parallel with the tibial axis (32).

Resect the tibia (33).

Checking Extension Gap and Axes

34a

34b

The Extension/Flexion Spacer (34a) can be connected to a 1 mm, 4 mm or 8 mm Shim to allow evaluation of higher thicknesses (34b):

$$10 \text{ mm} + 1 \text{ mm Shim} = 11 \text{ mm}$$

$$10 \text{ mm} + 4 \text{ mm Shim} = 14 \text{ mm}$$

$$12 \text{ mm} + 4 \text{ mm Shim} = 16 \text{ mm}$$

$$10 \text{ mm} + 8 \text{ mm Shim} = 18 \text{ mm}$$

ATTENTION: Use the Extension/Flexion Spacer for Micro-Sizes in small knees

To check the extension gap, fully extend the leg and place the Extension/Flexion Spacer between the two resected surfaces. The extension gap should be rectangular with the leg in full extension. If the extension gap is not balanced, adjust the angle of either the tibial or the femoral cut, or perform appropriate soft-tissue releases to achieve balance. If desired, perform a gentle varus/valgus stress test with the Flexion/Extension Spacer in place. Typically 1 mm to 3 mm of opening both medially and laterally is desirable.

If desired, the two-piece Alignment Rod can be inserted into the Extension/Flexion Spacer to assess alignment (34).

ATTENTION: At this stage it is only possible to check the extension gap.

Femoral Sizing and Rotation

Femoral Sizing Guide

ATTENTION: The *LinkSyphoKnee* Femoral Sizing Guide is posterior referencing only.

The femoral rotation can be set from 0° to 9° by rotating the Femoral Rotation Knob towards the "L" half circle or the "R" half circle, for a left knee or a right knee respectively (35).

The *LinkSyphoKnee* Femoral Sizer allows to assess the final femoral A/P size and it features 11 Femoral Size Markings: Sizes 0-10.

ATTENTION: The *LinkSyphoKnee* Femoral Sizer is used for a Measured Resection surgical philosophy and is not a measurement device.

Instruments

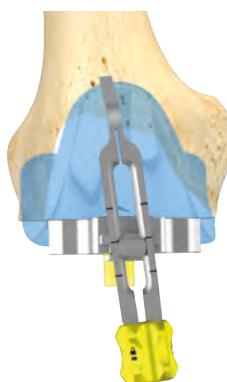

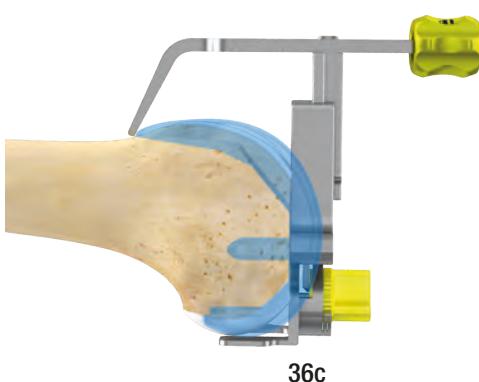

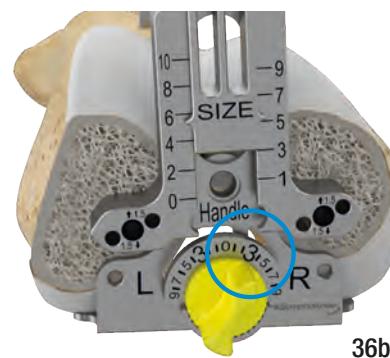

881-100/00
Femoral Sizing Guide

Position the Femoral Sizing Guide so that the flat surface of the instrument is flush against the resected distal femur and the posterior paddles are flush against the posterior condyles (36a).

Adjust the degree of external rotation to be parallel to the epicondylar axis and perpendicular to Whiteside's line by rotating the Femoral Rotation Knob, while holding the feet of the device against the posterior condyles (36a & 36b).

Place the Femoral Stylus on the anterior femur with the tip referencing the desired exit point of the Sawblade for the anterior cut (36c & 36d). Medio-lateral alignment: This is usually half way up the lateral, anterior prominence of the femoral trochlea (36d).

36d

37

OPTIONAL: To assess the femoral rotation compared to the tibial axes, attach the Quick Connect Handle to the Femoral Sizing Guide. The alignment can be checked by ensuring that the Alignment Rod remains parallel with the tibial axis (37).

Read the A/P femoral size shown by the Size Indicator directly on the scale marked on the body of the Femoral Sizer (38).

ATTENTION: Close the Femoral Stylus Locking Knob before reading the A/P femoral size (36a).

38

Instruments

881-100/00
Femoral Sizing Guide

445-113/20
Alignment Rod, long

445-112/00
Handle, quick connect

OPTIONAL: To reproduce the known deficiency of the bone, a Femoral Posterior Shim can be used (2 mm, 3 mm or 4 mm thick) (38a). Select the Posterior Shim thickness that represents the thickness of the missing bone on the hypoplastic condyle. Place the Posterior Shim on the paddle of the Femoral Sizing Guide. A magnet will hold the construct in place (38b).

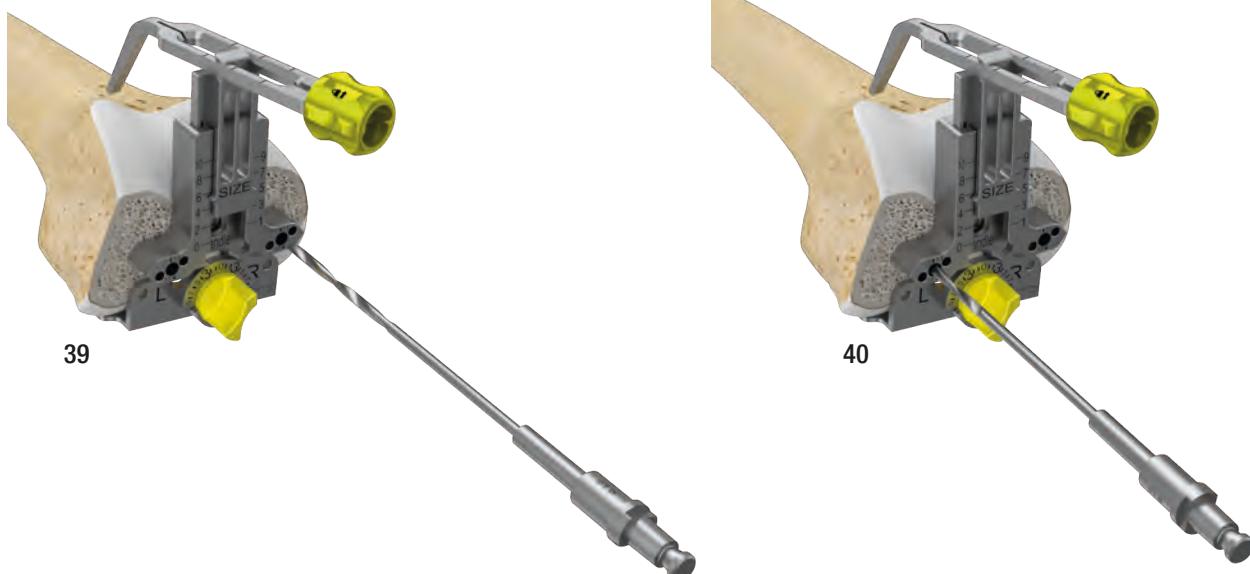

38a

38b

Once femoral rotation is set and size confirmation is complete, drill the holes for the 4-in-1 Femoral Cutting Block using the 3-mm Twist Drill through the 4-in-1 Femoral Cutting Block holes on the body of the Femoral Sizing Guide (39 & 40).

ATTENTION: The *LinkSyphoKnee* Femoral Sizing Guide features alternate holes that can be drilled through the
 ↑ 1.5 mm (1.5 mm more anterior holes) or
 ↓ 1.5 mm (1.5 mm more posterior holes)
 shift holes on the face of the Sizing Guide.

ATTENTION: The final M/L position of the Femoral Component is not determined during this step, but is addressed later in the surgical technique. This step just sets the M/L position of the 4-in-1 Cutting Block.

Remove the Femoral Sizing Guide.

Instruments

881-100/00
Femoral Sizing Guide

15-2040/02B
Twist Drill, Ø 3 mm

881-109/03
Shim, Femoral Sizing Guide,
H = 3 mm

Femoral 4-in-1 Resection

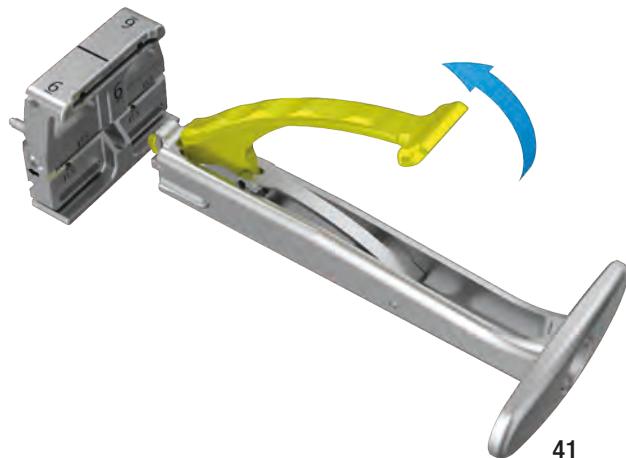

Select the 4-in-1 Femoral Cutting Block that matches the femoral A/P size previously determined.

ATTENTION: The *LinkSyphoKnee* Instrument Set features eleven 4-in-1 Femoral Cutting Blocks, one for each A/P femoral size.

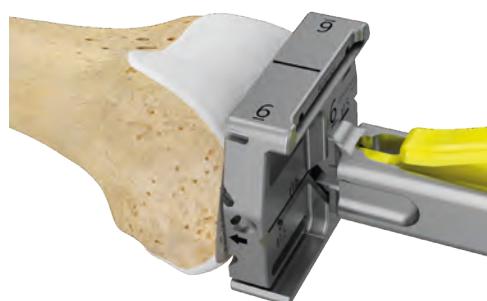

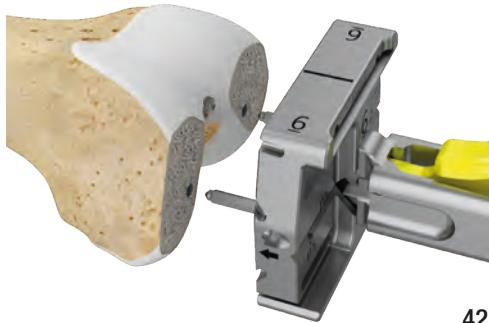

The *LinkSyphoKnee* 4-in-1 Femoral Cutting Block mimics precisely the M/L size of the standard final femoral components (0-10).

The M/L size of the wide femoral components (3+, 4+, 5+) can be assessed later in the surgical technique.

Open the Impactor/Extractor Handle lever and insert it into the 4-in-1 Femoral Cutting Block (41). Secure the Impactor/Extractor Handle to the 4-in-1 Femoral Cutting Block by closing the lever.

Place the 4-in-1 Femoral Cutting Block on the femur by aligning the 2 pegs on the back of the block with the previously drilled positioning holes (42).

Impact the 4-in-1 Femoral Cutting Block until it is flush with the femur (43).

Detach the Impactor/Extractor Handle, leaving the 4-in-1 Femoral Cutting Block flush on the distal femur.

Instruments

881-119/60
4-in-1 Femoral Cutting Block,
size 6

445-207/00
Impactor/Extractor Handle

OPTIONAL: Insert the Cutting Template (44) or a pin (45) through the lateral side of the anterior slot of the 4-in-1 Femoral Cutting Block to verify the correct anterior resection before cutting the femur and to ensure that notching is unlikely to occur.

44

45

OPTIONAL (only for Distal Cut First and Tibia First techniques): The flexion gap can be checked by using the Flexion Spacer in combination with the 4-in-1 Femoral Cutting Block. The Flexion Spacer is placed between the 4-in-1 Femoral Cutting Block (with its stepped side pushed as far as possible under the unresected femoral condyles) and the resected tibia (46).

ATTENTION: Use the the Flexion Spacer for Micro-Sizes with femoral sizes 0, 1 and 2.

ATTENTION: The Flexion Spacer is designed to assess the flexion gap in combination with the 4-in-1 Femoral Cutting Block only.

46

The Flexion Spacer can be connected to a 1 mm, 4 mm or 8 mm Shim to allow evaluation of multiple thicknesses:

$$10 \text{ mm} + 1 \text{ mm Shim} = 11 \text{ mm}$$

$$10 \text{ mm} + 4 \text{ mm Shim} = 14 \text{ mm}$$

$$12 \text{ mm} + 4 \text{ mm Shim} = 16 \text{ mm}$$

$$10 \text{ mm} + 8 \text{ mm Shim} = 18 \text{ mm}$$

Repositioning of the 4-in-1 Femoral Cutting Block

If the flexion gap is not equivalent to the extension gap or if there is a risk of unacceptable notching, it is possible to change the size of the 4-in-1 Femoral Cutting Block. This will alter the anterior femoral resection while keeping the same positioning holes (**47**).

ATTENTION: At this stage changing the size of the 4-in-1 Femoral Cutting Block will only affect the anterior cut (Posterior Referencing).

Alternate holes can then be drilled through the \uparrow 1.5 mm or \downarrow 1.5 mm shift holes on the face of the 4-in-1 Femoral Cutting Block (**48**). The 4-in-1 Femoral Cutting Block then needs to be removed and placed on the distal femur in the anteriorized or posteriorized holes. This will result in a 1.5 mm anterior or posterior shift of the 4-in-1 femoral resections (1.5 mm in A/P is equal to half size difference). Use the Cutting Template to verify that the desired anterior and posterior resections will be attained.

ATTENTION: Use the Impactor/Extractor Handle or the Slaphammer to axially remove the 4-in-1 Femoral Cutting Block (**49**).

OPTIONAL: Use the A/P Femoral Shift Block to move the 4-in-1 Femoral Cutting Block more than 1.5 mm. Place the A/P Femoral Shift Block on the distal femur in the holes for the 4-in-1 Femoral Cutting Block.

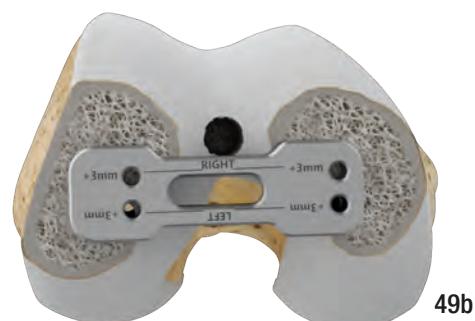

Alternate holes can then be drilled through the +3 mm shift holes on the face of A/P Femoral Shift Block (**49b**).

Remove the A/P Femoral Shift Block

(3 mm in A/P is equal to 1 size difference).

The 4-in-1 Femoral Cutting Block then needs to be placed on the distal femur in the anteriorized holes.

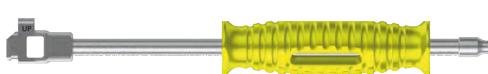

This will result in a 3 mm anterior shift of the 4-in-1 femoral resections. Turn the A/P Femoral Shift Block to drill the holes for a 3 mm posterior shift.

Instruments

Femoral 4-in-1 Resection

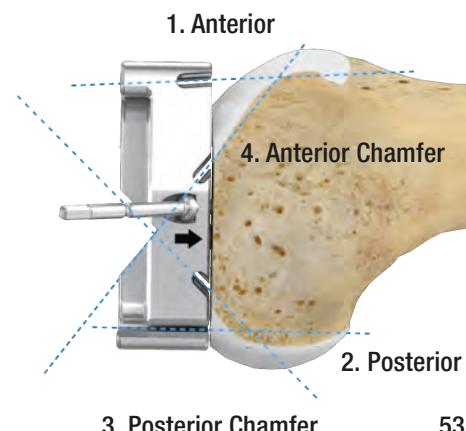

After final placement of the 4-in-1 Femoral Cutting Block, insert two Headed Drill Pins into the oblique pin holes on the medial and lateral aspects of the Cutting Block.

ATTENTION: The left and the right oblique pins point upwards in all 4-in-1 Femoral Cutting Blocks (50).

This pattern of fixation coupled with the pegs on the 4-in-1 Femoral Cutting Block should provide ample stability of the block (51).

Protecting the collateral ligaments, use a max. 1.27 mm thick oscillating sawblade to complete anterior, posterior, anterior chamfer and posterior chamfer resections (52 & 53).

Upon completion of the cuts, remove all Pins and use the Impactor/Extractor Handle or the Slaphammer to axially remove the 4-in-1 Femoral Cutting Block (54).

Femoral Box Preparation

Fixed Bearing PS (Posterior Stabilized)

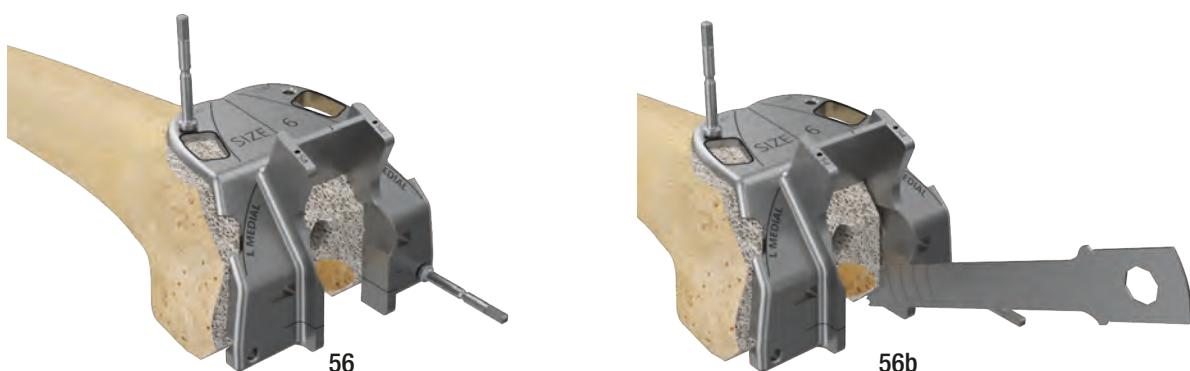

The Femoral PS Box Guide is selected according to the size of the femur and is positioned on the resected end of the femur. Alignment is performed on the notch and the M/L dimension (**55**).

The *LinkSyphoKnee* Instrument Set features fourteen Femoral PS Box Guides, one for each femoral size.

ATTENTION: The Femoral PS Box Guide is symmetrically designed to permit universal use. The M/L width of the Femoral PS Box Guide mimics the outer edges ("R Lat" Right Lateral and "L Lat" Left Lateral) of the final implant. Take care to position the guide to avoid overhang.

The Femoral PS Box Guide is fixed with at least two Headed Drill Pins (**56**). Using a narrow Saw Blade, saw the PS box (**56b**), taking care of not cutting through the CCK slot (CCK preparation only).

ATTENTION: When completing the notch cut, be careful to avoid excessive angulation of the Saw Blade or penetration past the posterior femoral cortex to avoid injury to the neurovascular structures. Avoid undercutting the condyles.

Instruments

Tibial Sizing

Attach the Quick Connect Handle to the appropriate Tibial Preparation Plate.

Place the Tibial Preparation Plate onto the resected tibial surface. Assess the tibial size to achieve maximal tibial coverage (59). Take care to put the Tibial Preparation Plate in the correct rotational alignment. To help alignment, insert the Alignment Rod into the Quick Connect Handle (60).

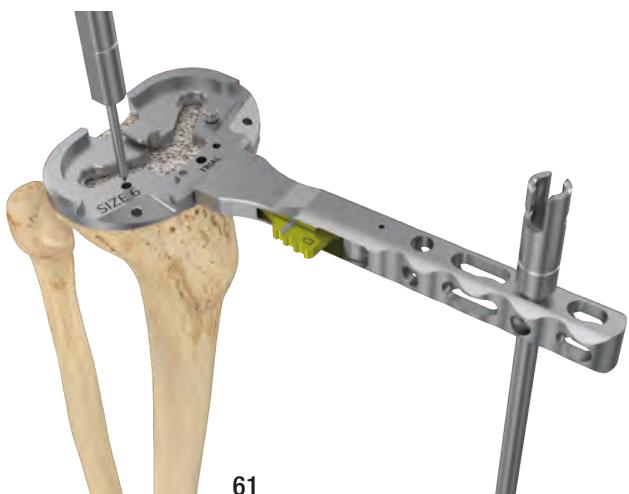

59

60

Secure the Tibial Preparation Plate by placing 2 or more Bone Nails in the dedicated holes of the Tibial Preparation Plate. Use the Universal Pin Inserter for driving and impacting the Bone Nails L = 25 mm or L = 35 mm (61).

Universal Pin Inserter

Tibial Preparation

Attach the Tibial Reamer Guide to the Tibial Preparation Plate (62). Drill the hole for the central tibial stem using the appropriate Tapered Reamer, until it stops onto the Tibial Reamer Guide (63 & 64).

ATTENTION: The *LinkSyphoKnee* Instrument Set features two Tapered Reamers:

- One for the Monoblock Tibial Component (881-062/00)
- One for the Tibial Component with Taper Cap (881-062/99)

OPTIONAL: Attachment for the Quick Connect Handle

Attach the size-specific Tibial Keel Punch to the Impactor/Extractor Handle. Choose the appropriate Tibial Keel Punch according to the size of the Tibial Preparation Plate.

ATTENTION: The *LinkSyphoKnee* Instrument Set features five Tibial Keel Punches, each for two tibial sizes: 1-2, 3-4, 5-6, 7-8 and 9-10.

Open the Impactor/Extractor Handle lever and insert it in the Tibial Keel Punch (65). Secure the Impactor/Extractor Handle to the Tibial Keel Punch by closing the lever.

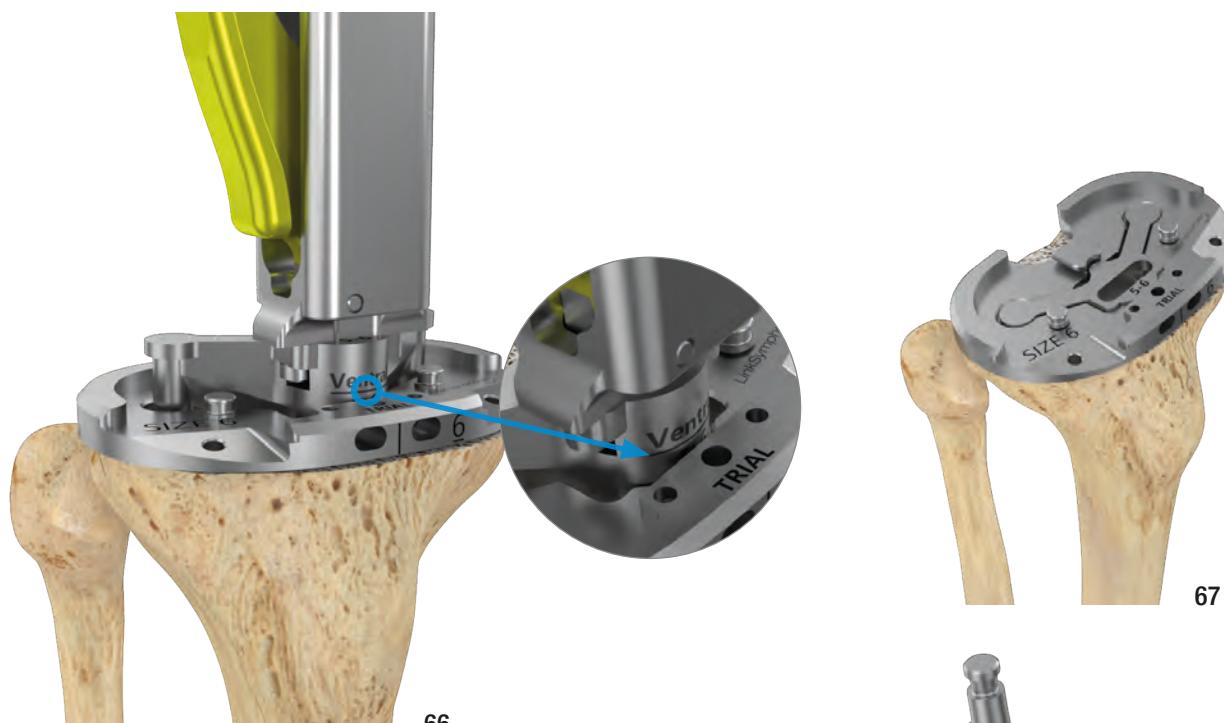

Instruments

ATTENTION: Insert the Tibial Keel Punch into the Tibial Preparation Plate by hand until it reaches the level indicated by the frontal marking (**66**).

Carefully impact the Tibial Keel Punch into the Tibial Preparation Plate until it is fully seated onto the Tibial Preparation Plate.

After the Tibial Keel Punch is fully seated, remove the Impactor/Extractor Handle. The Tibial Keel Punch sits in the Tibial Preparation Plate and acts as the trial stem (**67**).

ATTENTION: Pre-drill the tibial peg holes with the Universal Drill if sclerotic bone is present (**67a**).

Instruments

Patella Preparation (Patella Resurfacing)

The following instructions describe how to use the *LinkSyphoKnee* Patella Component and they assume the use of the instrument set available for this procedure.

Sizing

A Patella Sizing Template corresponding to the implants is available (68). The size of implant is determined by placing the Sizing Template slightly medial and superior on the patella surface (69).

68

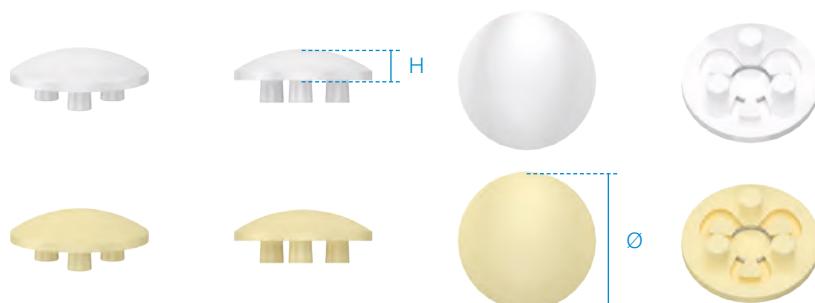

69

ATTENTION: The *LinkSyphoKnee* includes 6 sizes of Patella Components.

Each size features a different implant thickness and diameter. In the table below, all Patella Component dimensions are shown.

LinkSyphoKnee Patella Components – 3-peg

cemented

| REF MAT | REF MAT | Ø mm | Height (H) mm |
|----------------------|-----------------------|---------|------------------|
| 880-501/25 UHMWPE | 880-511/25 E-Dur * | 25 | 6 |
| 880-501/28 | 880-511/28 | 28 | 6 |
| 880-501/31 | 880-511/31 | 31 | 7 |
| 880-501/34 | 880-511/34 | 34 | 8 |
| 880-501/37 | 880-511/37 | 37 | 9 |
| 880-501/40 | 880-511/40 | 40 | 10 |

* E-Dur = Highly crosslinked UHMWPE (X-Linked PE) with Vit-E

Instruments

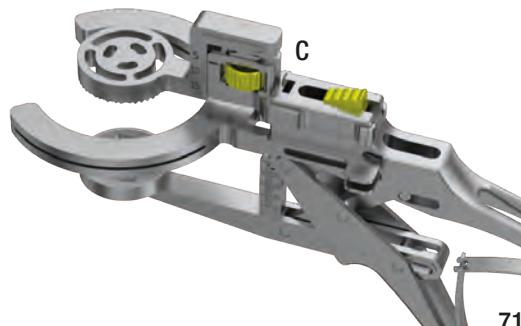

881-509/00
Patella Sizing Template

Patella Resection

Insert the Resection Guide (A) into the second groove from the top of the Patella Clamp Handle (B) (70). Now, insert the Depth Gauge (C) into the first groove from the top of the Patella Clamp Handle (B) (71).

Set the appropriate resection level corresponding to the size of the patella component previously determined (72).

Position the Patella Clamp so that the sectional plane lies parallel to the extended patellar tendon. The Depth Gauge must lie on the bone. While pressing the hand grips, the Patella Clamp firmly fixes the patella by means of the integrated ratchet (73). If necessary, release the ratchet by pressing the trigger on the Patella Clamp Handle.

ATTENTION: It is important to ensure that the remaining patella is sufficiently thick (min. 12 mm).

The resection is carried out using an oscillating saw with a max. 1.27 mm thick Sawblade. The saw is guided using the saw slots of the Resection Guide (74).

881-500/00
Patella Clamp,
Depth Gauge

Drilling the Anchoring Holes

Insert the Drill Guide (E) for the anchoring holes into the first slot from the top of the Patella Clamp Handle (B) (75).

Position the Patella Clamp onto the previously resected patella surface and use the Universal Drill (H) for the anchoring holes. To prepare the seat for the anchoring holes, push the Universal Drill until stop (76). A Patella Trial can now be used (76a).

Trial Reduction and Functional Test

The Femoral Trial (CR or PS) is selected according to the resected femoral size and is positioned using the Femoral Inserter/Extractor (77).

The *LinkSyphoKnee* Instrument Set features a specific femoral trial component for each femoral size and for each configuration.

Femoral Trial CR

Attach the Impactor/Extractor Handle to the Femoral Impactor Tip (**78a**).

Use the assembly to fully seat the Femoral Trial Component (**78**).

For CR Femur only, the lug holes are drilled using the Universal Drill (**79**).

The remaining posterior condyles and osteophytes can be removed using the curved Femoral Chisel (**80**).

The Trial Plateau is selected and used according to which type of prosthesis is chosen – Fixed Bearing CR, Fixed Bearing PS or PS+ (81).

Select the appropriate thickness of the Trial Plateau:

10 mm, 11 mm, 12 mm or 14 mm.

ATTENTION: For adjusting the height of the Trial Plateau beyond 14 mm, use the +4 mm Shim in combination with the 12 mm Trial Plateau to reach 16 mm total thickness, or in combination with the 14 mm Trial Plateau to reach 18 mm total thickness.

Select the appropriate size of the Trial Plateau. The following table shows the possible *LinkSympoKnee* size combinations:

| CR Femoral Component | | | | | | | | | | | | |
|----------------------|-----------------------------|-----------------------------|---|-----------------------------|------|-----------------------------|---|------------------------------|---|---|----|--|
| Tibial Component | 0 | 1 | 2 | 3/3+ | 4/4+ | 5/5+ | 6 | 7 | 8 | 9 | 10 | |

Final Implantation – Modular Tibia Base

Taper Cap or Stem Extension Assembly

When using a modular tibial component with Taper Cap or with Stem Extension, ensure that the tibia is prepared accordingly.

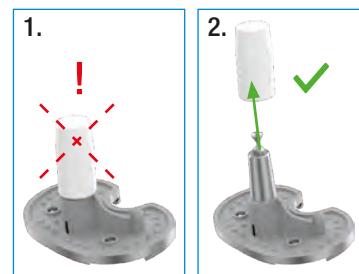

ATTENTION: Carefully remove the Safety Cap from the taper. The Safety Cap protects the Cone Adapter during transportation (84a).

ATTENTION: The Cone Adapter is pre-assembled to the Tibial implant.

ATTENTION: If the Cone Adapter is not assembled or is loose, use the Screwdriver for the Cone Adapter to tighten it to the femoral and tibial component (84b).

ATTENTION: The Taper Cap or the Stem Extension is fixed primarily by a morse taper connection and firmly secured by one Security Screw.

Overtake the modular Tibial Component. Slide the chosen Taper Cap or Stem Extension onto the male morse taper of the Tibial Component (84c).

84a

84b

84c

Ensure the coupling of the Taper Cap or Stem Extension with the Tibial Component by impacting with a hammer.

ATTENTION: To avoid a metal on metal contact between the Taper Cap and the Hammer, use the Tibial/Femoral Coupling Base Tip.

Connect the Tibial/Femoral Coupling Base Tip with the Impactor/Extractor Handle (85a).

Slide the Tibial/Femoral Coupling Base Tip onto the top of the Taper Cap. Two Hammer blows are enough (85b).

Use the Torque Wrench (hex 2.5 mm) to tighten the Security Screw until it stops (86).
Final Tibial Component assembly (87).

Fixed Bearing

The implantation sequence for *LinkSympoKnee* Fixed Bearing CR (Cruciate Retaining) and Fixed Bearing PS (Posterior Stabilized) is described below:

- 1 Fixed Bearing Tibial Component implantation
- 2 Femoral Component implantation
- 3 Fixed Bearing PE Articulating Surface implantation

1 Fixed Bearing Tibial Component Implantation

Prepare the sclerotic bone to ensure a continuous cement mantle with good cement interdigitation of 2 mm - 4 mm. This can be done by drilling holes and cleansing the bone with pulsatile lavage.

A thick layer of cement can be placed either on the bone or on the implant (87a). It has to be observed that the bone facing side of the tibial component consisting of the metal tray, its keel and stem are completely anchored in bone cement.

Apply a layer of bone cement to the bone facing side of the Tibial Component, to the bone, or both.

Attach the Tibial Inserter to the Fixed Bearing Tibial Component (87b).

Carefully insert the Fixed Bearing Tibial Component, avoiding malrotation, and impact into place (87c).

If needed, the Tibial Impactor Tip, assembled with the Impactor/Extractor Handle (87d), can be used to complete the seating of the component (87e).

Complete implantation with several hammer blows to the top of assembly. Then use a Curette to remove all extruded cement.

87a

ATTENTION: Ensure that excess bone cement is completely removed and no loose bone cement particles remain, especially in the posterior part of the joint.

OPTIONAL:

Instruments

881-042/00
Tibial Inserter

445-207/00
Impactor/Extractor Handle

881-042/99
Tibial Impactor Tip

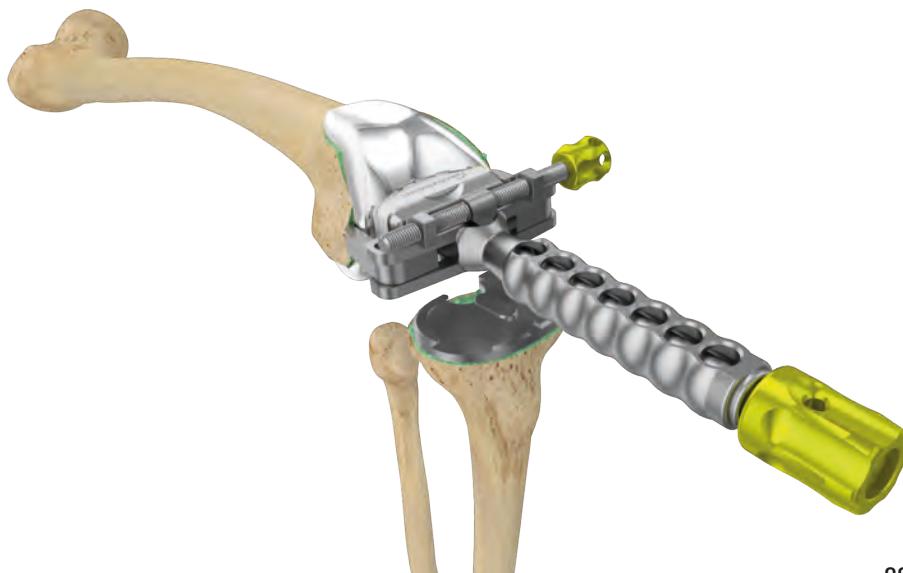

2 Femoral Component Implantation

The bone cement is prepared following the specific manufacturer's instructions.

Apply a layer of bone cement to the backside of the Femoral Component, to the bone, or both.

Place the selected Femoral Component onto the bone by hand or, if preferred, use the Femoral Inserter/Extractor.

Deliver several hammer blows to the Femoral Inserter/Extractor (88).

88

89

Release the Femoral Inserter/Extractor and use the Femoral Impactor Tip (assembled to the Impactor/Extractor Handle) to complete the component impaction (89). Then use a Curette to remove all extruded cement.

ATTENTION: Ensure that excess bone cement is completely removed and no loose bone cement particles remain, especially in the posterior part of the joint.

ATTENTION: The cementless Femoral Component is inserted and impacted directly into the resected femoral bone without applying bone cement.

Instruments

3 Fixed Bearing PE Articulating Surface

OPTIONAL: A trial reduction may be performed using Trial Plateaus (90).

The Fixed Bearing PE Articulating Surface (Fixed Bearing CR or Fixed Bearing PS or fixed Bearing PS+) is selected.

Select the appropriate size of the Fixed Bearing PE Articulating Surface. The following table shows the possible *LinkSyphoKnee* size combinations:

Tibial Component

| | 0 | 1 | 2 | 3/3+ | 4/4+ | 5/5+ | 6 | 7 | 8 | 9 | 10 |
|----|-----------------------------|-----------------------------|---|-----------------------------|------|-----------------------------|---|------------------------------|---|---|----|

Instruments

881-235/10
Trial Plateau PS,
size 5-6, H = 10 mm

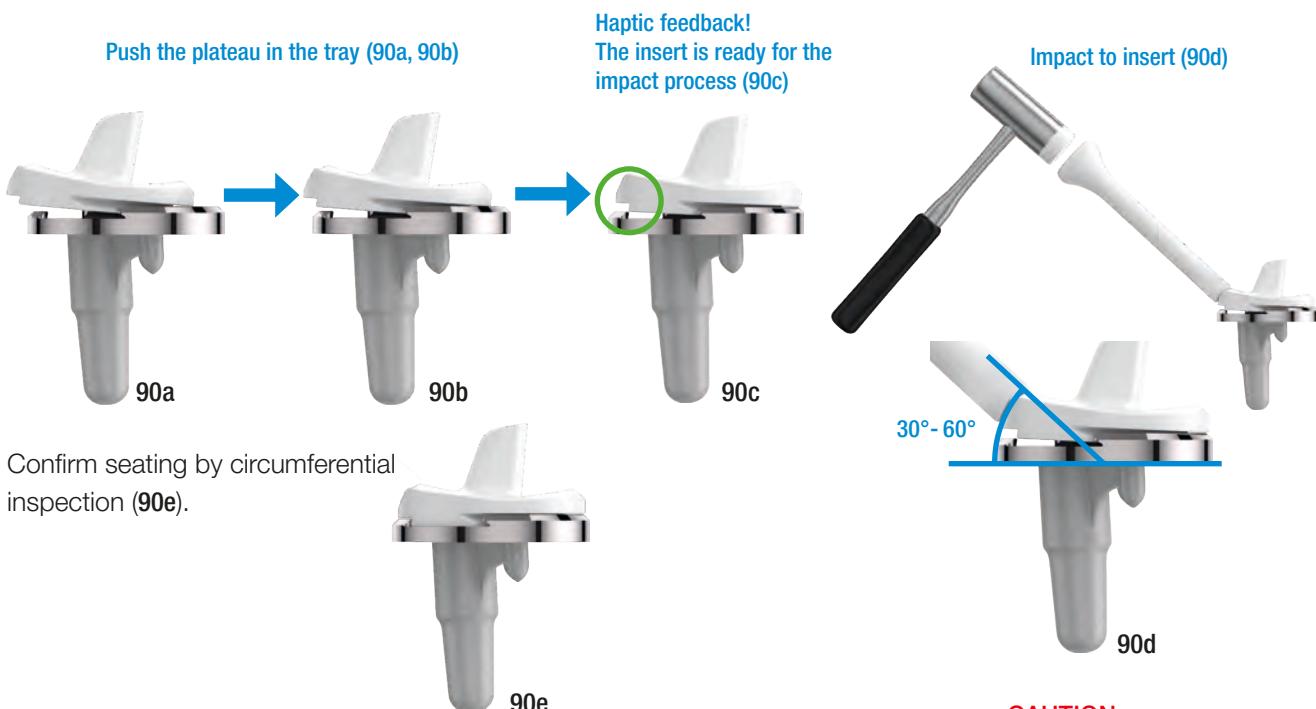

Select the appropriate thickness of the Fixed Bearing PE Articulating Surface.

The locking mechanism must sit in its resting position before impact. Therefor the following sequences must be followed.

Please take particular note that all debris and especially bone cement particles are carefully removed from the surface of the Tibial Component.

First the Fixed Bearing PE Articulating Surface is pushed as far posteriorly as it will go before impaction (90a-c). The PE posterior lip must rest beneath the posterior dovetail of the Tibial Component.

Then position the Articulating Surface Impactor **between 30 and 60 degrees** on the insert so that the notch rests on the anterior edge of the center of the insert (90d). Use a mallet to strike the Articulating Surface Impactor.

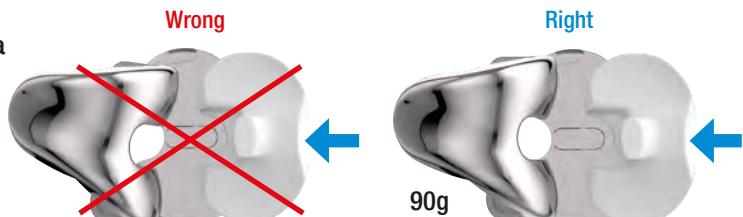

For appropriate insertion of the PE Articulating Surface for LinkSymphoKnee configuration PS, PS+ and CCK, the following aspects are to be considered:

Preventing the post-cam mechanism from pushing the PE Articulating Surface out of position. While pushing the insert to its resting position it only can be pushed until reaching the post (90f). If so the tibia has to be moved anteriorly. It can be beneficial to move the knee into extension to help releasing the post cam mechanism.

The rotation and the M/L position of the tibia has to be aligned to the femoral component.

It is important that the post is properly aligned with the femoral box by internally rotating the tibia (90g).

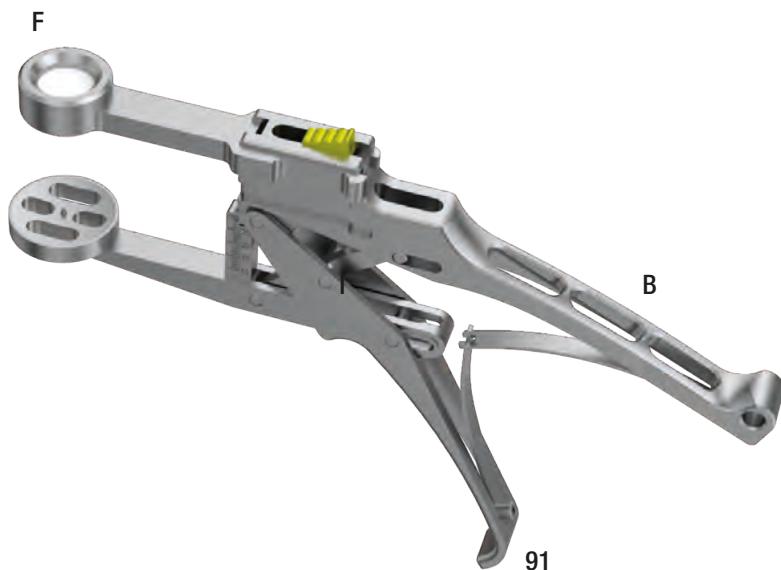

Instruments

881-040/01
Articulating Surface Impactor

Patella Implantation

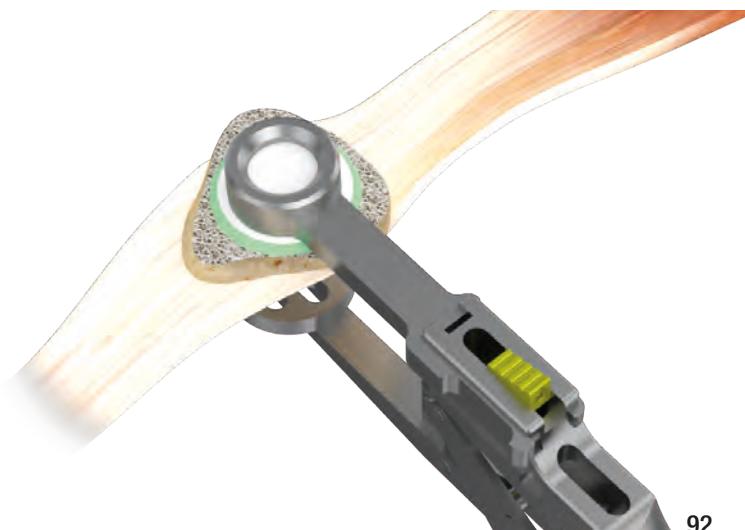

Insert the Clamp Arm (F) into the first slot from the top of the Patella Clamp Handle (B) (91).

The bone cement is prepared following the specific manufacturer's instructions.

Following extensive rinsing and removal of all impeding soft tissue, the bone cement is applied to the back of the implant, and the implant is placed by hand and pressed on using the Patella Clamp Handle with the Clamp Arm (92).

ATTENTION: Ensure that excess bone cement is completely removed and no loose bone cement particles remain in the joint.

Instruments

445-902/00
Patella Clamp,
Handle

445-904/00
Patella Clamp, Arm

Functional Test

Perform a final functional test through an entire range of motion to check that all components are properly positioned, and also to check for proper ligament tension and patella tracking (**93 & 94**).

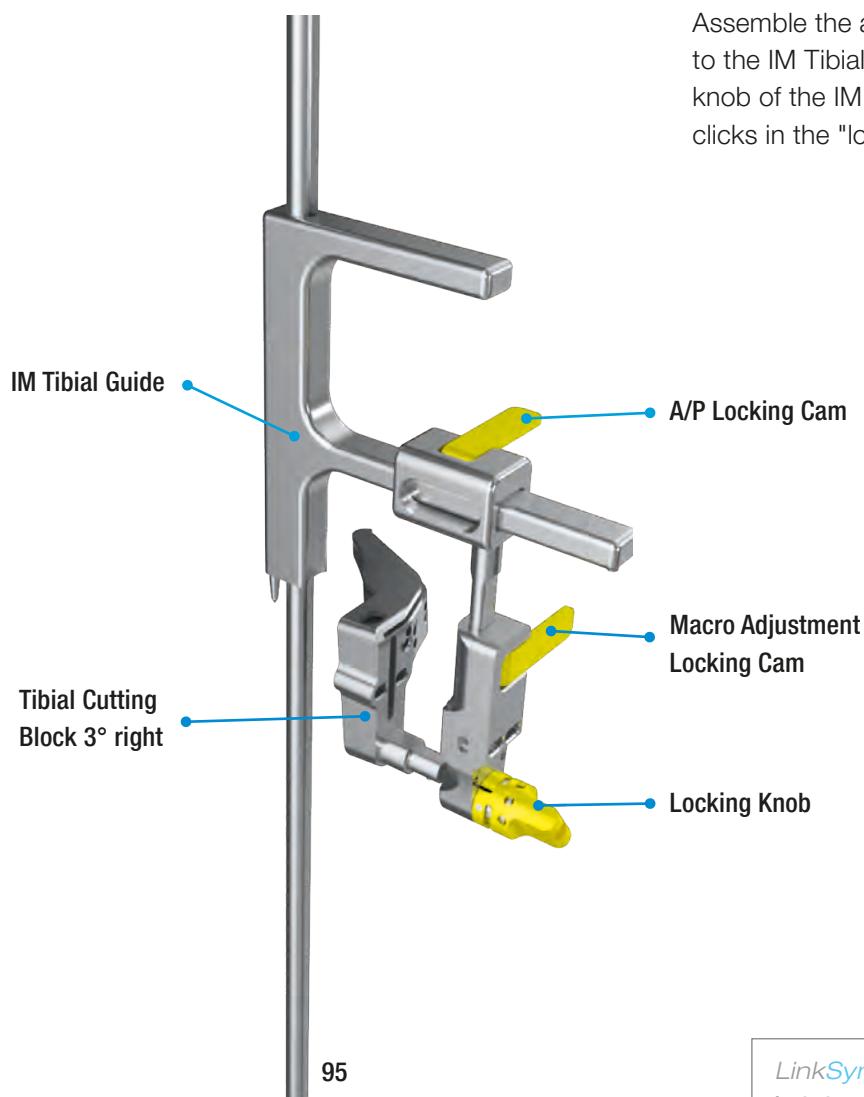

LinkSyphoKnee Fixed Bearing CR
(Cruciate Retaining).

LinkSyphoKnee Fixed Bearing PS/PS+
(Posterior Stabilized / Posterior Stabilized+).

Appendix 1, IM Tibial Guide

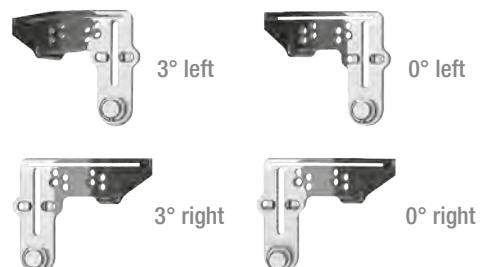

Intramedullary Tibial Guide Assembly

Assemble the appropriate Tibial Cutting Block to the IM Tibial Guide and lock it by twisting the knob of the IM Tibial Guide clockwise until it clicks in the "lock position" (95).

95

LinkSyphoKnee Instrument Set
includes the following Tibial Cutting Blocks:

Instruments

445-109/00
IM Tibial Guide

881-210/03
Tibial Cutting Block, 3° right

Intramedullary Tibial Guide Alignment

Open the tibial canal using the Starting Reamer. Insert the IM Tibial Guide, assembled together with the Intramedullary Rod, into the tibia (96).

OPTIONAL: To assess tibial alignment, attach the Quick Connect Handle to the IM Tibial Guide, and insert the Alignment Rod. Rotation and alignment can be checked by ensuring that the Alignment Rod remains parallel with the tibial axis.

Impact the IM Tibial Guide onto the proximal tibia.

Instruments

Setting the Tibial Resection Level

Insert the foot of the Adjustable Stylus into the slot of the Tibial Cutting Block and adjust it to the appropriate level. Release the Locking Cam on the IM Tibial Guide, allowing for macro-adjusting the height of the Tibial Cutting Block (97).

The scale on the body of the Adjustable Stylus indicates the amount of bone and residual cartilage to be resected.

ATTENTION:

LinkSyphoKnee Fixed Bearing CR (Cruciate Retaining), **Fixed Bearing PS** (Posterior Stabilized), **Fixed Bearing PS+** (Posterior Stabilized +) and **All-Poly PS Tibial Component** feature 10 mm of minimal tibial component thickness (tibial baseplate + PE articulating surface).

Set the Adjustable Stylus according to the patient's anatomic situation, avoiding excessive tibial resection. Confirm tibial resection level using Cutting Template introduced as a free saw blade into the Cutting Block.

After the Tibial resection level has been set, close the Macro Adjustment Locking Cam and pin the Tibial Cutting Block through the anterior parallel "0" holes, using two Drill Pins.

Remove the IM Tibial Guide and resect the tibia. The resection level can be adjusted by using the distal or proximal pin holes, which move the block 2 mm more proximal, 2 mm more distal or 4 mm more distal. If desired, the Cutting Block can be more securely fixed with an additional Headed Drill Pin placed through one of the distal angled holes (98).

Symbol Description: ✓ = Combination allowed

99

| All-Poly PS Tibial Component | Size | All-Poly PS Trial Component Construct |
|------------------------------|-------|--|
| | 1 | Tibial Preparation Plate, size 1 + Trial Plateau PS, size 1-2 |
| | 1up | Tibial Preparation Plate, size 1 + Trial Plateau PS, size 1-2up |
| | 2 | Tibial Preparation Plate, size 2 + Trial Plateau PS, size 1-2 |
| | 2up | Tibial Preparation Plate, size 2 + Trial Plateau PS, size 1-2up |
| | 3down | Tibial Preparation Plate, size 3 + Trial Plateau PS, size 3-4down |
| | 3 | Tibial Preparation Plate, size 3 + Trial Plateau PS, size 3-4 |
| | 4down | Tibial Preparation Plate, size 4 + Trial Plateau PS, size 3-4 down |
| | 4 | Tibial Preparation Plate, size 4 + Trial Plateau PS, size 3-4 |
| | 5 | Tibial Preparation Plate, size 5 + Trial Plateau PS, size 5-6 |
| | 6 | Tibial Preparation Plate, size 6 + Trial Plateau PS, size 5-6 |
| | 7 | Tibial Preparation Plate, size 7 + Trial Plateau PS, size 7-8 |
| | 8 | Tibial Preparation Plate, size 8 + Trial Plateau PS, size 7-8 |
| | 9 | Tibial Preparation Plate, size 9 + Trial Plateau PS, size 9-10 |
| | 10 | Tibial Preparation Plate, size 10 + Trial Plateau PS, size 9-10 |

The All-Poly PS Tibial Components are available in 10, 12 and 14 mm height only.

For the Trial use the following combinations:

Tibial Preparation Plate + 10 mm Trial Plateau = 10 mm All-Poly Tibial Component

Tibial Preparation Plate + 12 mm Trial Plateau = 12 mm All-Poly Tibial Component

Tibial Preparation Plate + 14 mm Trial Plateau = 14 mm All-Poly Tibial Component

Prepare the sclerotic bone to ensure a continuous cement mantle with good cement interdigititation of 2-4 mm. This can be done by drilling holes and cleansing the bone with pulsatile lavage. A thick layer of cement can be placed either on the bone or on the implant (**99b** & **99c**). It has to be observed that the bone facing side of the All-Poly Tibial Component, its keel and stem are completely anchored in bone cement. Apply a layer of bone cement to the bone facing side of the All-Poly PS Tibial Component, to the bone, or both (**99b** & **99c**).

Carefully insert by hand the All-Poly PS Tibial Component, avoiding malrotation.

The All-Poly Tibial Impactor Tip (assembled with the Impactor/Extractor Handle) can be used to complete the seating of the component.

Complete implantation with several hammer blows to the top of Tibial Impactor. Then use a Curette to remove all extruded cement (**100**).

ATTENTION: Ensure that excess bone cement is completely removed and no loose bone cement particles remain, especially in the posterior part of the joint (**101**).

Appendix 3, CCK Femoral Preparation

The *Link SyphoKnee* Instruments allow for a conversion from PS femoral preparation to a CCK femoral preparation in a few steps.

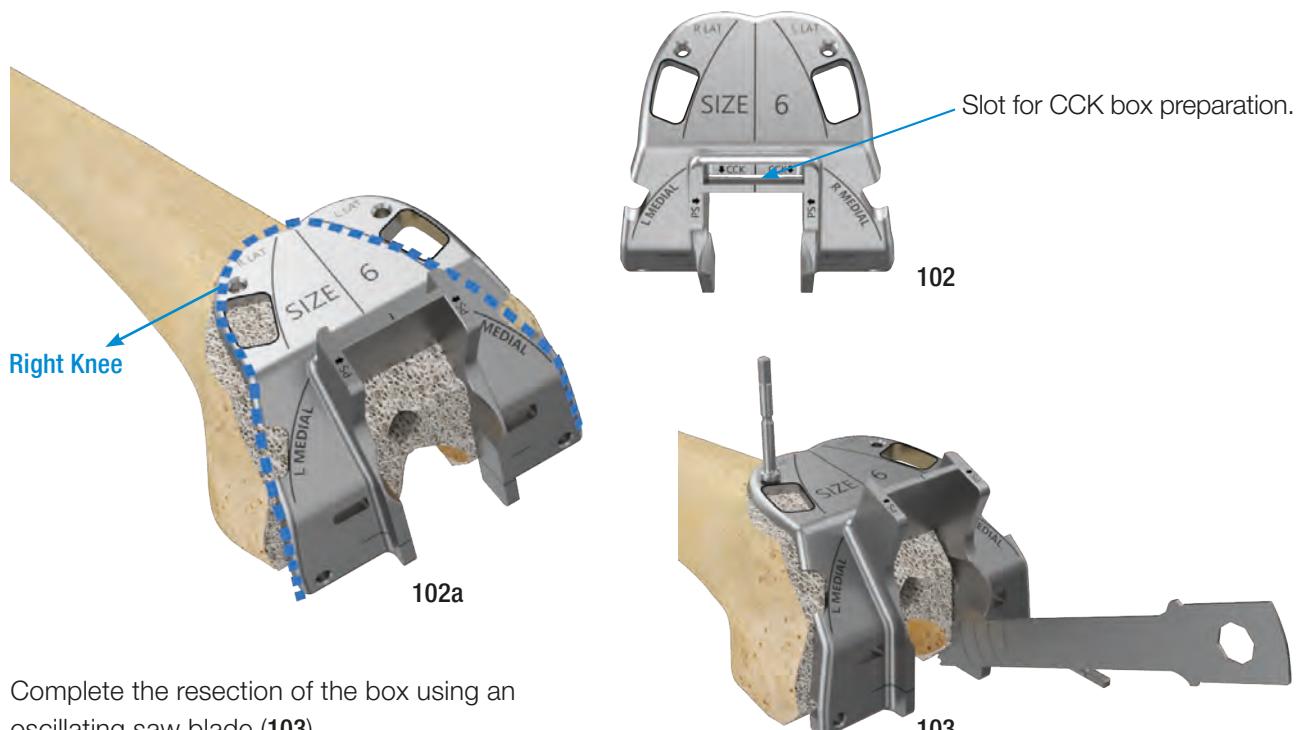

The Femoral PS Box Guide is selected according to the size of the femur and is positioned on the resected end of the femur. Alignment is performed on the notch and the M/L dimension.

The *Link SyphoKnee* Instrument Set features fourteen Femoral PS Box Guides, one for each femoral size.

ATTENTION: The Femoral PS Box Guide is symmetrically designed to permit universal use. The M/L width of the Femoral PS Box Guide mimics the outer edges ("R Lat" Right Lateral and "L Lat" Left Lateral) of the final implant. Take care to position the guide to avoid overhang (**102a**).

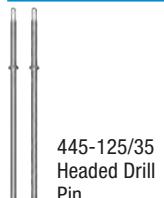

Fix the Femoral PS Box Guide with at least two Headed Drill Pins.

Saw the femoral box with a narrow sawblade using the proximal slot marked with "CCK" (**102**). This resection allows preparation of the femoral box for the CCK femoral components.

ATTENTION: When completing the notch cut, be careful to avoid excessive angulation of the Saw Blade or penetration past the posterior femoral cortex to avoid injury to the neurovascular structures. Avoid undercutting the condyles.

Femoral PS Box Guide,
size 6

Attach the Reamer Guide for Femoral Box CCK to the Femoral PS Box Guide (104)

ATTENTION: The Reamer Guide for Femoral Box CCK is suitable for left and right knees. Ensure that the Reamer Guide for the Femoral Box CCK is assembled correctly according to the operated leg.

Ream until the stop, using the Tapered Reamer, CCK (105).

Release the Femoral Inserter/Extractor and use the Femoral Impactor Tip (assembled to the Impactor/Extractor Handle) to complete the trial component impaction (108).

108

The *Link SyphoKnee* CCK Femoral Components can be combined with Fixed Bearing PS and PS+ Articulating Surfaces.

The following table shows the possible *Link SyphoKnee* size combinations of the CCK Femoral Component with PS and PS+ Articulating Surfaces:

| CCK Femoral Component | | | | | | | | | | | | |
|-----------------------|---------------------------------------|---|---|---|------|---------------------------------|---|---|----------------------------------|---|----|--|
| | 0 | 1 | 2 | 3/3+ | 4/4+ | 5/5+ | 6 | 7 | 8 | 9 | 10 | |
| 1 | PS/PS+ Articulating Surface 1-2 | | | PS/PS+ Articulating Surface 1-2up | | x | x | x | x | x | x | |
| | | | | | | x | x | x | x | x | x | |

Extraction of Femoral Trial Component

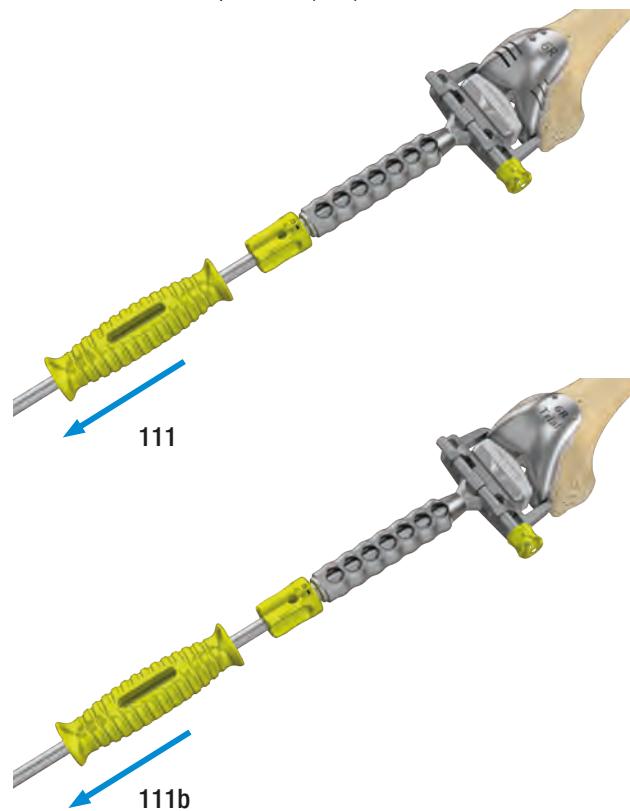

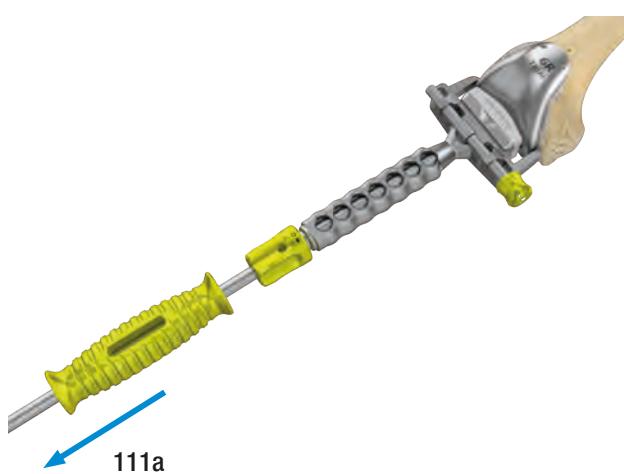

OPTIONAL: In order to extract the Femoral Trial Components, it is possible to use the Slaphammer in combination with the Femoral Inserter/Extractor (109)

Assemble the Femoral Inserter/Extractor on the CCK Femoral Trial component (110).

Use the Femoral Inserter/Extractor and Slaphammer to remove the Femoral Trial (111).

ATTENTION: The same Femoral Inserter/Extractor and Slap Hammer can be used to remove the CR trial (111a) and the PS Trial components (111b).

CCK Femoral Component with Modular Stem Assembly

Select the final stem, referencing to the ones used for the Trial Assembly.

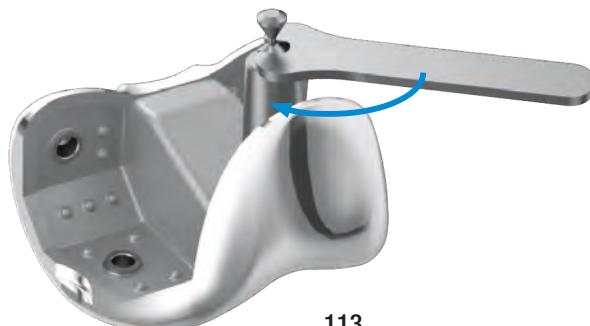

ATTENTION: Carefully remove the Safety Cap from the taper. The Safety Cap protects the Cone Adapter during transportation (112).

112

ATTENTION: The Cone Adapter is pre-assembled to the Femoral implant.

ATTENTION: If the Cone Adapter is not assembled or is loose, use the Screwdriver for the Cone Adapter to tighten it to the femoral component (113).

113

ATTENTION: To avoid a metal on metal contact between the Stem and the Hammer, use the Tibial/Femoral Coupling Base Tip.

Connect the Tibial/Femoral Coupling Base Tip with the Impactor/Extractor Handle (114).

Appendix 4 Valgus/Varus Tibial Recut

2° Valgus Recut Guide

If a 2° valgus correction cut is needed, place the Tibial Cutting Block Valgus re-cut on the proximal cut of the resected tibia, aligning with the previously defined A/P axis of the tibia (112).

Once it has been determined that the desired correction cut will be attained, slide the medial portion of the Tibial Cutting Block Valgus re-cut so it is flush with the medial portion of the tibial cortex to provide a planar recut of the tibia.

Confirm the tibial resection plane using Cutting Template introduced as a free saw blade into the Cutting Block.

Perform resection. Remove the pins and the Tibial cutting Block Valgus re-cut.

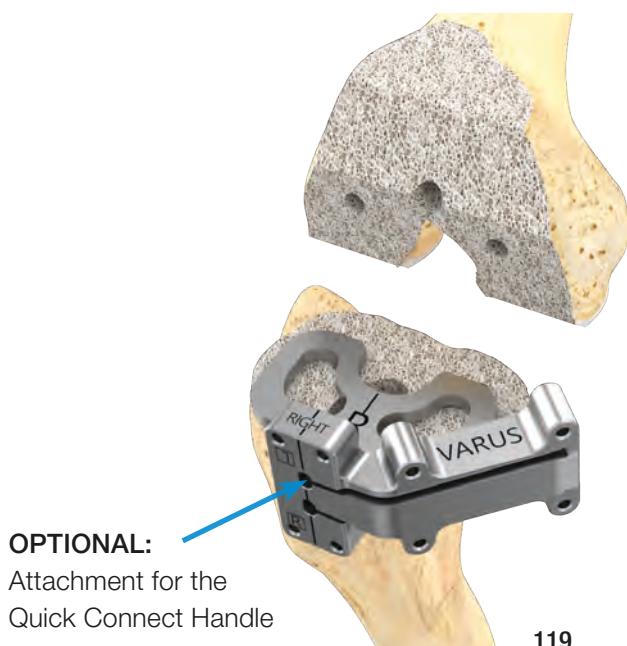

2° Varus Recut Guide

If a 2° varus correction cut is needed, place the Tibial Cutting Block Varus re-cut on the resected tibial plateau, aligning with the previously defined A/P axis of the tibia (113).

Once it has been determined that the desired correction cut will be attained, slide the lateral portion of the Tibial Cutting Block Varus re-cut so it is flush with the lateral portion of the tibial cortex to provide a planar recut of the tibia.

Confirm the tibial resection plane using Cutting Template introduced as a free saw blade into the Cutting Block.

Perform resection. Remove the pins and the Tibial Cutting Block Varus re-cut.

| Specified Indications and Contraindications: LinkSyphoKnee System | |
|---|--|
| LinkSyphoKnee Cruciate Retaining Fixed Bearing (CR FB) | |
| Indications: | |
| Any form of uni-, bi- or tricompartimental arthritis of the knee joint (e.g. primary degenerative arthritis, secondary arthritis resulting from rheumatoid arthritis, fracture, post-infection, gout, chondrocalcinosis and others) | |
| Contraindications (absolute): | |
| Acute and chronic infections, local and systemic, insofar as they may compromise the successful implantation | |
| Moderate or severe instability or complete loss of the medial or collateral ligament | |
| Instability or loss of the posterior cruciate ligament | |
| Any bone defect that will result in insufficient implant fixation (based on the fact, that using stems, bone grafts and metal bone substitutes like cones, a minimum bone stock for implant fixation cannot be defined) | |
| Severe insufficiency or loss of extensor mechanism | |
| Contraindications (relative): | |
| Extension deficit >30° | |
| Varus or valgus deformity >30° | |
| Allergy to one of the implant materials | |
| LinkSyphoKnee Posterior Stabilized Fixed Bearing and All-Poly (PS FB and PS All-Poly) | |
| Indications: | |
| Any form of uni-, bi- or tricompartimental arthritis of the knee joint (e.g. primary degenerative arthritis, secondary arthritis resulting from rheumatoid arthritis, fracture, post-infection, gout, chondrocalcinosis and others) | |
| Contraindications (absolute): | |
| Acute and chronic infections, local and systemic, insofar as they may compromise the successful implantation | |
| Moderate or severe instability or complete loss of the medial or collateral ligament | |
| Any bone defect that will result in insufficient implant fixation (based on the fact, that using stems, bone grafts and metal bone substitutes like cones, a minimum bone stock for implant fixation cannot be defined) | |
| Severe insufficiency or loss of extensor mechanism | |
| Contraindications (relative): | |
| Allergy to one of the implant materials | |
| LinkSyphoKnee Posterior Stabilized Plus Fixed Bearing (PS+ FB) | |
| Indications: | |
| Any form of uni-, bi- or tricompartimental arthritis of the knee joint (e.g. primary degenerative arthritis, secondary arthritis resulting from rheumatoid arthritis, fracture, post-infection, gout, chondrocalcinosis and others) | |
| Contraindications (absolute): | |
| Acute and chronic infections, local and systemic, insofar as they may compromise the successful implantation | |
| Severe instability or complete loss of the medial or collateral ligament | |
| Any bone defect that will result in insufficient implant fixation (based on the fact, that using stems, bone grafts and metal bone substitutes like cones, a minimum bone stock for implant fixation cannot be defined) | |
| Severe insufficiency or loss of extensor mechanism | |
| Contraindications (relative): | |
| Situations in which an overall leg alignment will result, that is outside a range of 5° varus or valgus in reference to the mechanical axis. In such a situation the PS+ mechanism may fail over time as a result of the shear forces | |
| Allergy to one of the implant materials | |
| LinkSyphoKnee Condylar Constrained Knee Fixed Bearing (CCK FB) | |
| Indications: | |
| Any form of uni-, bi- or tricompartimental arthritis of the knee joint (e.g. primary degenerative arthritis, secondary arthritis resulting from rheumatoid arthritis, fracture, post-infection, gout, chondrocalcinosis and others) | |
| Contraindications (absolute): | |
| Acute and chronic infections, local and systemic, insofar as they may compromise the successful implantation | |
| Complete loss of the medial or collateral ligament | |
| Any bone defect that will result in insufficient implant fixation (based on the fact, that using stems, bone grafts and metal bone substitutes like cones, a minimum bone stock for implant fixation cannot be defined) | |
| Severe insufficiency or loss of extensor mechanism | |
| Contraindications (relative): | |
| Situations in which an overall leg alignment will result, that is outside a range of 5° varus or valgus in reference to the mechanical axis. In such a situation the CC mechanism may fail over time as a result of the shear forces | |
| Allergy to one of the implant materials | |

Implants with TiNbN-Coating

In contrast to all other implants an allergy against one of the implant materials is not a contraindication. Otherwise the above mentioned indications and contraindications depending on the design of the TiNbN-coated implants remain the same.

Please note:

These indications/contraindications refer to standard cases. The ultimate decision on whether or not an implant is suitable for a patient must be made by the surgeon based on his/her individual analysis and his/her experience.

Please note the following regarding the use of our implants:

1. Choosing the right implant is very important.

The size and shape of the human bone determines the size and shape of the implant and also limits the load capacity. Implants are not designed to withstand unlimited physical stress. Demands should not exceed normal functional loads.

2. Correct handling of the implant is very important.

Under no circumstances should the shape of a finished implant be altered, as this shortens its life span. Our implants must not be combined with implants from other manufacturers. The instruments indicated in the Surgical Technique must be used to ensure safe implantation of the components.

3. Implants must not be reused.

Implants are supplied sterile and are intended for single use only. Used implants must not be used again.

4. After-treatment is also very important.

The patient must be informed of the limitations of the implant. The load capacity of an implant cannot compare with that of healthy bone!

5. Unless otherwise indicated, implants are supplied in sterile packaging.

Note the following conditions for storage of packaged implants:

- Avoid extreme or sudden changes in temperature.
- Sterile implants in their original, intact protective packaging may be stored in permanent buildings up until the "Use by" date indicated on the packaging.
- They must not be exposed to frost, dampness or direct sunlight, or mechanical damage.
- Implants may be stored in their original packaging for up to 5 years after the date of manufacture. The "Use by" date is indicated on the product label.
- Do not use an implant if the packaging is damaged.

6. Traceability is important.

Please use the documentation stickers provided to ensure traceability.

7. Further information on the material composition is available on request from the manufacturer.

Follow the instructions for use!
